Effect of aminoguanidine, a nitric oxide synthase inhibitor, on ischemic brain edema in rats. The cerebral edema induced by transient middle cerebral artery occlusion (MCAO) in rats is often used as a model of ischemic brain edema. Although nitric oxide (NO) is well-known to play a key role in ischemic brain edema, the precise mechanism has not yet been clarified. We evaluated the effect of aminoguanidine (AG), a selective inhibitor of inducible NO synthase, on ischemic brain edema, using a model of MCAO in rats. Brain water content was measured to evaluate the cerebral edema. In the sham group, brain water content increased from 71.6% to 79.6% 24 h after the MCAO. Aminoguanidine (100 mg/kg) significantly decreased brain water content in MCAO rats from 79.3% to 77.8%, indicating that AG decreased the cerebral edema. The reduction of cerebral edema by AG may be due to the direct inhibition of inducible NO synthase.
